

HyphaLink EEI is a complex inoculant derived from a diverse blend of endo and ecto mycorrhizae, trichoderma, beneficial bacteria, soluble humate, soluble seaweed, soluble yucca, amino acids, and a complete B-Complex vitamin package with other valuable vitamins and biological compounds. It is designed to be effective for a wide variety of plant species and soils.

Mycorrhizae fungi attach to plant roots and create a web-like network that increases the surface area of nutrient absorption for plants. If you are uncertain whether this product is designed for your specific plants, please contact Organic Approach for details.

Product Specifications:

Ectomycorrhizae Fungi Matrix:

1.38 billion propagules (spores) per pound.

Endomycorrhizae Fungi Matrix:

43,648 propagules (spores) per pound

Trichoderma Fungi Matrix:

333.96 million CFU's (colony forming units) per pound.

Beneficial Bacteria Matrix:

97.08 billion CFU's (colony forming units) per pound.

Keep out of the reach of children

Net Weight: 1.0 lb.

Description For Use:

HyphaLink EEI is suitable for use on all plants at any stage of growth, from seeds to transplants to mature plantings.

Standard Dilution Ratios:

HyphaLink EEI	Vol. of Water
2.25 grams	1 gallon
0.4 ounces	5 gallons
2 ounces	25 gallons
4 ounces	50 gallons
8 ounces	100 gallons
1 pound	200 gallons

Transplants and Existing Plants:

HyphaLink EEI may be used as a drench over-top of the soil or as an injection into the soil. It may also be sprayed or soaked onto B&B plant stock balls. Apply anytime during the active growing season. Apply ½ gallon of solution per gallon of container size (i.e. 2½ gallons for a 5-gallon container) or for 4 gallons of solution for each 1" caliper of tree.

Nursery Stock:

Use solution as a soil drench. One pound (200 gallons of solution) will treat about 2,000 square feet of groundcovers or quart plants and about 4,000 square feet of gallon-size or larger plants.

HyphaLink EEI is designed to pass through any application equipment using a screen size of 50-mesh or larger. This is about 300 microns. Finer screens will not allow the fungal organisms to pass through the filter or will tear the hyphal strands.
